Also described is a compound 8 to 50 nucleobases in length targeted to the nucleic acid encoding the human RNase HI polypeptide, where the compound specifically hybridises with and inhibits the expression of a human RNase HII polypeptide. The compound, which is an antisense oligonucleotide, is useful for inhibiting the expression of a human RNase HII polypeptide or central to a seociated with a human RNase HII polypeptide. The method is useful for inhibiting the expression of a protein, particularly for reducing cellular RNA via antisense technology. The present sequence represents human RNase HI given in the exemplification of the present invention

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics. obesity,

Claim 1; Page 161; 586pp; English

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOVI). Also described: (1) a composition comprising a polypeptide containers, the composition described above; 1) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the above vector; (6) an isolated nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or uncleic acid molecule in a gample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of screening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (10) a method of or producing the above polypeptide in a method for producing the above polypeptide. NOVX immunomodulator, cytostatic, nootropic, neuroprotective, antipatkinsonian and antilipamenic activities, and can be used in gene therapy. The collypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic syndrome associated with a human disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polypeptide so that cleavage of an RNA strand of an oligonucleotide-RNA complex duplex occurs. Also described is a compound 8 to 50 nucleobases in length targeted to the nucleic acid encoding the human RNase HII polypeptide, where the compound specifically hybridises with and inhibits the expression of a human RNase HII polypeptide. The compound, which is an antisense oligonucleotide, is useful for inhibiting the expression of a human RNase HII polypeptide in cells or tissues, as well as for treating an animal with a disease or condition associated with a human RNase HII polypeptide. The method is useful for inhibiting the expression of a protein, particularly for reducing cellular RNA via antisense technology. The present sequence represents a human RNase HII protein sequence, given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hydrolyses RNA in RNA-DNA hybrids, and the activity of RNase H1 is Mg.2 dependent and inhibited by both Mn+2 and the sulphydryl blocking agent N-ethylmaleimide. The amino acid sequence of human RNase H1 displays strong homology with RNase H1 from yeast, chicken, B. coli and mouse. This sequence was used to generate RNase H1 mutants (see ABB83372-ABB83376) by site-directed mutagenesis. By studying the mutants generated in the present invention, it was found that although the conserved amino acid residues of the putative catalytic site and basic substrate-binding domain are required for RNase H activity, deletion of either the catalytic site or the basic substrate binding domain did not ablate binding to the heteroduplex substrate

The present sequence is a mutant RNase H1 sequence. RNase H hydrolyses CC RNA in RNA-DNA hybrids, and the activity of RNase H1 is Mg+2 dependent created by both Mn+2 and the sulphydryl blocking agent N-cethylmaleimide. The amino acid sequence of human RNase H1 displays strong Chomology with RNase H1 from yeast, chicken, E. coli and mouse. This sequence was generated from the wild-type human RNase H1 sequence (ABB83371) by site-directed mutagenesis. It was found that although the conserved amino acid residues of the putative catalytic site and basic substrate-binding domain are required for RNase H activity, deletion of cither the catalytic site or the basic substrate-binding domain did not undetectable rate of cleavage of a heteroduplex substrate, i.e. the mutation ablated the cleavage of a heteroduplex substrate, i.e. the mutation ablated the cleavage activity of the enzyme. Note: The present sequence was not shown in the specification, but was derived from the construction and the sequence shown on Fig 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel human RNase H1 polypeptide comprising mutations compared to wild type human RNase H1 useful for inhibiting expression of selected protein by antisense oligonucleotide targeted to RNA encoding selected protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Misc-difference

The present sequence is a mutant RNase H1 sequence. RNase H hydrolyses RNA in RNA-DNA hybrids, and the activity of RNase H1 is Mg+2 dependent and inhibited by both Mn+2 and the sulphydryl blocking agent N-ethylmaleimide. The amino acid sequence of human RNase H1 displays strong homology with RNase H1 from yeast, chicken, E. coli and mouse. This sequence was generated from the wild-type human RNase H1 sequence (ABB83371) by site-directed mutagenesis. It was found that although the conserved amino acid residues of the putative catalytic site and basic substrate-binding domain are required for RNase H activity, deletion of either the catalytic site or the basic substrate binding domain did not ablate binding to the heteroduplex substrate. This mutant exhibited an undetectable rate of cleavage of a heteroduplex substrate, i.e. the mutation ablated the cleavage activity of the enzyme. Note: The present
                                                                                                                                                                                                                                                                                                                  Novel human RNase H1 polypeptide comprising mutations compared to wild type human RNase H1 useful for inhibiting expression of selected protein by antisense oligonucleotide targeted to RNA encoding selected protein.
Sequence
                       mutation ablated the cleavage activity of the enzyme. Note: The pesequence was not shown in the specification, but was derived from wild-type human RNase HI sequence shown on Fig 1
                                                                                                                                                                                                                                                                                     Disclosure; Page; 39pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      homology with RNase H1 from yeast, chicken, E. coli and mouse. This sequence was generated from the wild-type human RNase H1 sequence (ABB83371) by site-directed mutagenesis. It was found that although the conserved amino acid residues of the putative catalytic site and basic substrate-binding domain are required for RNase H activity, deletion of either the catalytic site or the basic substrate-binding domain did not ablate binding to the heteroduplex substrate. This mutant exhibited an undetectable rate of cleavage of a heteroduplex substrate, i.e. the mutation ablated the cleavage activity of the enzyme. Note: The present sequence was not shown in the specification, but was derived from the wild-type human RNase H1 sequence shown on Fig 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ethylmaleimide.

                                                                                                                                                                                              Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present sequence is a mutant RNase H1 sequence. RNase H hydrolyses in RNA-DNA hybrids, and the activity of RNase H1 is Mg+2 dependent inhibited by both Mn+2 and the sulphydryl blocking agent N-ylmaleimide. The amino acid sequence of human RNase H1 displays strong ology with RNase H1 from yeast, chicken, E. coli and mouse. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          241

RNase H hydrolyses CC RNA in RNA-DNA hybrids, and the activity of RNase H1 is Mg+2 dependent CC and inhibited by both Mn+2 and the sulphydryl blocking agent N-CC ethylmaleimide. The amino acid sequence of human RNase H1 displays strong CC homology with RNase H1 from yeast, chicken, E. coli and mouse. This CC sequence was generated from the wild-type human RNase H1 sequence CC (ABBB3371) by site-directed mutagenesis. It was found that although the CC conserved amino acid residues of the putative catalytic site and basic CC substrate-binding domain are required for RNase H activity, deletion of CC either the catalytic site or the basic substrate-binding domain ald not CC initial cleavage rate, of a heteroduplex substrate. This mutant exhibited an CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost two orders CC initial cleavage rate, of a heteroduplex substrate, of almost initial cleavage rate, of a heteroduplex substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

CC The present sequence is a mutant RNase H1 sequence. RNase H hydrolyses CC RNA in RNA-DNA hybrids, and the activity of RNase H1 is Mg+2 dependent CC and inhibited by both Mn+2 and the sulphydryl blocking agent N-CC ethylmaleimide. The amino acid sequence of human RNase H1 displays strong CC homology with RNase H1 from yeast, Chicken, E. coli and mouse. This CC sequence was generated from the wild-type human RNase H1 sequence CC (ABB3371) by site-directed mutagenesis. It was found that although the CC conserved amino acid residues of the putative catalytic site and basic CC substrate-binding domain are required for RNase H activity, deletion of CC either the catalytic site or the basic substrate-binding domain did not CC conserved amino acid residues of the putative catalytic sequence was not shown in the specification, but-was derived from the CCC wild-type human RNase H1 sequence shown on Fig 1

                                                                                                                                                                                                                                                                                                ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to new isolated NOVX polypeptides, the genes CC encoding them or sequences having at least 95% identity to the amino acid CC or nucleotide sequences. The NOVX polypeptide is useful as a therapeutic, CC particularly in the manufacture of a medicament for treating a syndrome CC associated with a human disease, which includes a pathology associated CC with NOVX polypeptide. The NOVX polypeptide is particularly useful for CC treating, preventing or alleviating pathology associated with NOVX polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and CC polypeptide are especially useful for treating or preventing e.g. CC diabetes, obesity, cancers (e.g. lymphoma, uterus cancer or prostate CC cancer), dyslipidemias, anorexia, wasting disorders, Alzheimer's disease, cardingtheses, anorexia, wasting disorders, Alzheimer's disease, conditiple sclerosis, hypertension, atherosclerosis, hemophilia, CC graft-versus-host disease or Albright hereditary osteodystrophy. The DNA CC conditions. These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic convertions. This sequence represents one of the NOVX proteins of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for promoting the inhibition of the expression of a protein comprising employing a mammalian RNase H polypeptide so that cleavage of an RNA strand of an oligonucleotide-RNA complex duplex occurs. Also described is a compound 8 to 50 nucleobases in length targeted to the nucleic acid encoding the human RNase HI polypeptide, where the compound specifically hybridises with and inhibits the expression of a human RNase HI polypeptide. The compound, which is an antisense oligonucleotide, is useful for inhibiting the expression of a human RNase HII polypeptide in cells or tissues, as well as for treating an animal with a disease or condition associated with a human RNase HII polypeptide. The method is useful for inhibiting the expression of a protein, particularly for reducing cellular RNA via antisense technology. The present sequence represents a mouse RNase HI protein sequence, given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mus sp

CC (e.g. NOVI). Also described: (1) a composition comprising a polypeptide containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector CC comprising the nucleic acid molecule described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector CC comprising the above vector; (6) an antibody that immunospecifically comprising the above vector; (6) an antibody that immunospecifically CC binds to the polypeptide described above; (7) methods for determining the comprising the presence of or predisposition to CC gample; (8) methods for determining the presence of or predisposition to CC adherence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a CC method of identifying an agent that binds to the polypeptide described above; (10) a method of identifying an agent that binds to the polypeptide described CC above; (10) a method for identifying a potential therapeutic agent for CC user and thysiological interactions of the polypeptide described CC apathology associated with the polypeptide; (12) a method of CC apathology associated with the polypeptide; (12) a method for modulating CC immunomodulator, cytostatic, nortcopic, natipating the above polypeptide in a CC acid molecule may be used to diagnose, treat or preventing an ind (14) a method for producing the above polypeptide in a CC syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic CC acid molecule may be used to diagnose, treat or prevent metabolic constructions of the polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic constructions. The nucleic acids can also be used as hybridiatation concer, and an interaction and various concer, and an interaction and the present sequence represents a human NOVX from the present sequence represents a human NOVX from the present t The present invention describes NOVX proteins, where X can be 1

CC containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector CC comprising the above vector; (6) an antibody that immunospecifically CC binds to the polypeptide described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically CC binds to the polypeptide described above; (7) methods for determining the presence of or predisposition to CC sample; (8) methods for determining the presence of or predisposition to CC a disease associated with altered levels of expression of the above cCC adservant physiological interactions of the polypeptide described CC use in treating a pathology that is related to an aberrant expression or CC aberrant physiological interactions of the polypeptide; (12) a method of CC apathology associated with the polypeptide; (12) a method of CC apathology associated with the polypeptide; (12) a method of CC apathology associated with the polypeptide; (12) a method of CC apathology associated with the polypeptide; (12) a method of CC apathology associated with the polypeptide; (12) a method of CC apathology associated with the polypeptide; (12) a method of CC apathology associated with the above polypeptide in a CC syndrome associated with a human disease. The polypeptide of treating a CC syndrome associated with a human disease. The polypeptide or the nucleic CC disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's CC dyslipidaemias. The nucleic acids can also be used as hybridisation and can be used an shybridisation and can be used an shybridisation and pharmacogenomics. The present sequence represents a human NOVX from the pharmacogenomics. The present sequence represents a human NOVX from the

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, cancer or dyslipidemia, and in chromosome mapping, tissue typing pharmacogenomics. obesity,

Claim 1; Page 160; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a

cc method of identifying an agent that binds to the polypeptide described cabove; (10) a method for identifying a potential theragentic agent for use in treating a pathology that is related to an aberrant expression or cc aberrant physiological interactions of the polypeptide; (11) a method of cc ereening for a modulator of activity or of latency or predisposition to ca pathology associated with the polypeptide; (12) a method for modulating cc recenting a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide. NOVX sequences have antidiabetic, anorectic, antibacterial, virucide, immunomodulator, cytostatic, nootropic, neuroprotective, antiparkinsonian cand antilipaemic activities, and can be used in gene therapy. The cc syndrome associated with a human disease. The polypeptide or the nucleic sold molecule may be used to diagnose, treat or prevent metabolic clisorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's clisease, immune disorders, haematopoietic disorders and various colds can also be used as hybridiastion and probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the present invention.

The products of the invention are useful in defining the interaction of human Type 2 RNase H and antisense oligonucleotides and identifying methods for enhancing this interaction so that antisense oligonucleotides are more effective at inhibiting their target mRNA. The products can be used for enhancing the efficacy of antisense oligonucleotide therapies. This sequence represents a mouse RNase H homologue described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                     E coli type II RNase H protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                            Escherichia coli

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of DNA-RNA oligonuclectides which can act as substrates for human RNase HI (a type II RNase). The sequence consists of two portions, one owhich is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is E. coli RNase HI

The sequence consists of two portions, one of which is capable of supporting cleavage of a complementary target RNA and the other of which is incapable of supporting such cleavage. These can be used to enhance the effectiveness of antisense therapies. The present sequence is chicken RNase H1
                                                                              New isolated human RNase H polypeptide and nucleic acid, used agents for enhancing the efficiency of antisense therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gallus sp

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel human RNase H polypeptide and nucleic acid which can be used to cleave the RNA strand of oligonucleotide-RNA duplexes and to develop agents for enhancing the efficiency of antisense therapy. The products of the invention are useful in defining the interaction of human Type 2 RNase H and antisense oligonucleotides and identifying methods for enhancing this interaction so that antisense oligonucleotides are more effective at inhibiting their target mRNA. The products can be used for enhancing the efficacy of antisense oligonucleotide therapies. This sequence represents the chicken type 2 RNase H described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                immunomodulator; cytostatic; nootropic; neuroprotective; antiparkinsonian; antilipaemic; gene therapy; human disease; metabolic disorder; diabetes; obesity; infection; cachexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease;

CC (e.g. NOV1). Also described: (1) a composition comprising a polypeptide CC described above and a carrier; (2) a kit comprising in one or more CC containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector CC comprising the nucleic acid molecule described above; (5) acid to the polypeptide described above; (7) methods for determining the CC presence or amount of the above polypeptide or nucleic acid molecule in a disease associated with altered levels of expression of the above; (8) methods for determining the presence of or predisposition to CC adisease associated with altered levels of expression of the above; (10) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for CC aberrant physiological interactions of the polypeptide; (11) a method of capability of a potential therapeutic agent for CC a pathology that is related to an aberrant expression or CC a pathology associated with the polypeptide; (11) a method of CC a pathology associated with the polypeptide; (12) a method for modulating CC immunomodulator; of activity or of latered polypeptide. NOVX CC sequences have antidiabetic, anotropic, neuroprotective, antiparkinsonian CC and antilipaemic activities, and can be used in gene therapy. The CC polypeptide is useful in manufacturing a medicament for treating a cCC syndrome associated with a human disease. The polypeptide or the nucleic disorders such as Alzheimer's disease or Parkinson's CCC disease, incurance disorders such as Alzheimer's disease or Parkinson's CCC disease, incurance adisorders, haematopoietic disorders and various of probes, in chromosome mapping, tissue typing, preventive medicitie and cprobes, in chromosome mapping, tissue typing, preventive medicitie and cprobes in a present sequence represents a human NOVX from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            29-OCT-2001;

                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating chila signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 152
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present invention
